

Environmental Atlas of California

Select CalEnviroScreen Visualizations
Across California Counties

CalEnviroScreen 3.0 Atlas

Executive Summary:

If we view the CalViroScreen3.0 Score as the overall environmental health of a given area, we do see a pattern emerge. Yes, scores do increase in and around heavily populated places such as San Francisco, Los Angeles and San Diego metroplexes. But looking beyond the obvious densely populated cities, we see a clear pattern through the Central Valley. While the Central Valley is home to numerous large cities, its population does not compare to the metroplexes. Yet this area shows a high concentration of environmental issues that defines this region. We could hypothesis that any number or a combination of factors is contributing to this pattern, such as the its geographic containment (valley surrounded by mountains), major transportation corridor (exhaust pollution), and/or the high development of agriculture in the region, among numerous other considerations. Further analysis would be required.

Interestingly enough and not surprising, we see the Pollution Burden indicators tracking fairly well along the Central Valley. Again, we do see spikes in the metroplexes, but a clear pattern of the highest burdens is present in the Central Valley. This is a strong indicator that the environmental hazards in the area are have a direct negative impact on the health and well being of the population in those areas.

Promise, Potential & Pitfalls of Automation in GIS and Cartography:

Automation, as in many applications, is especially useful in iterating over tedious, repetitive tasks. It brings efficiency and consistency to the task at hand. This increases the quantity of production and thus reduces the cost associated with producing it. Automation is at its best in well-defined, simple repetitions over a uniform material.

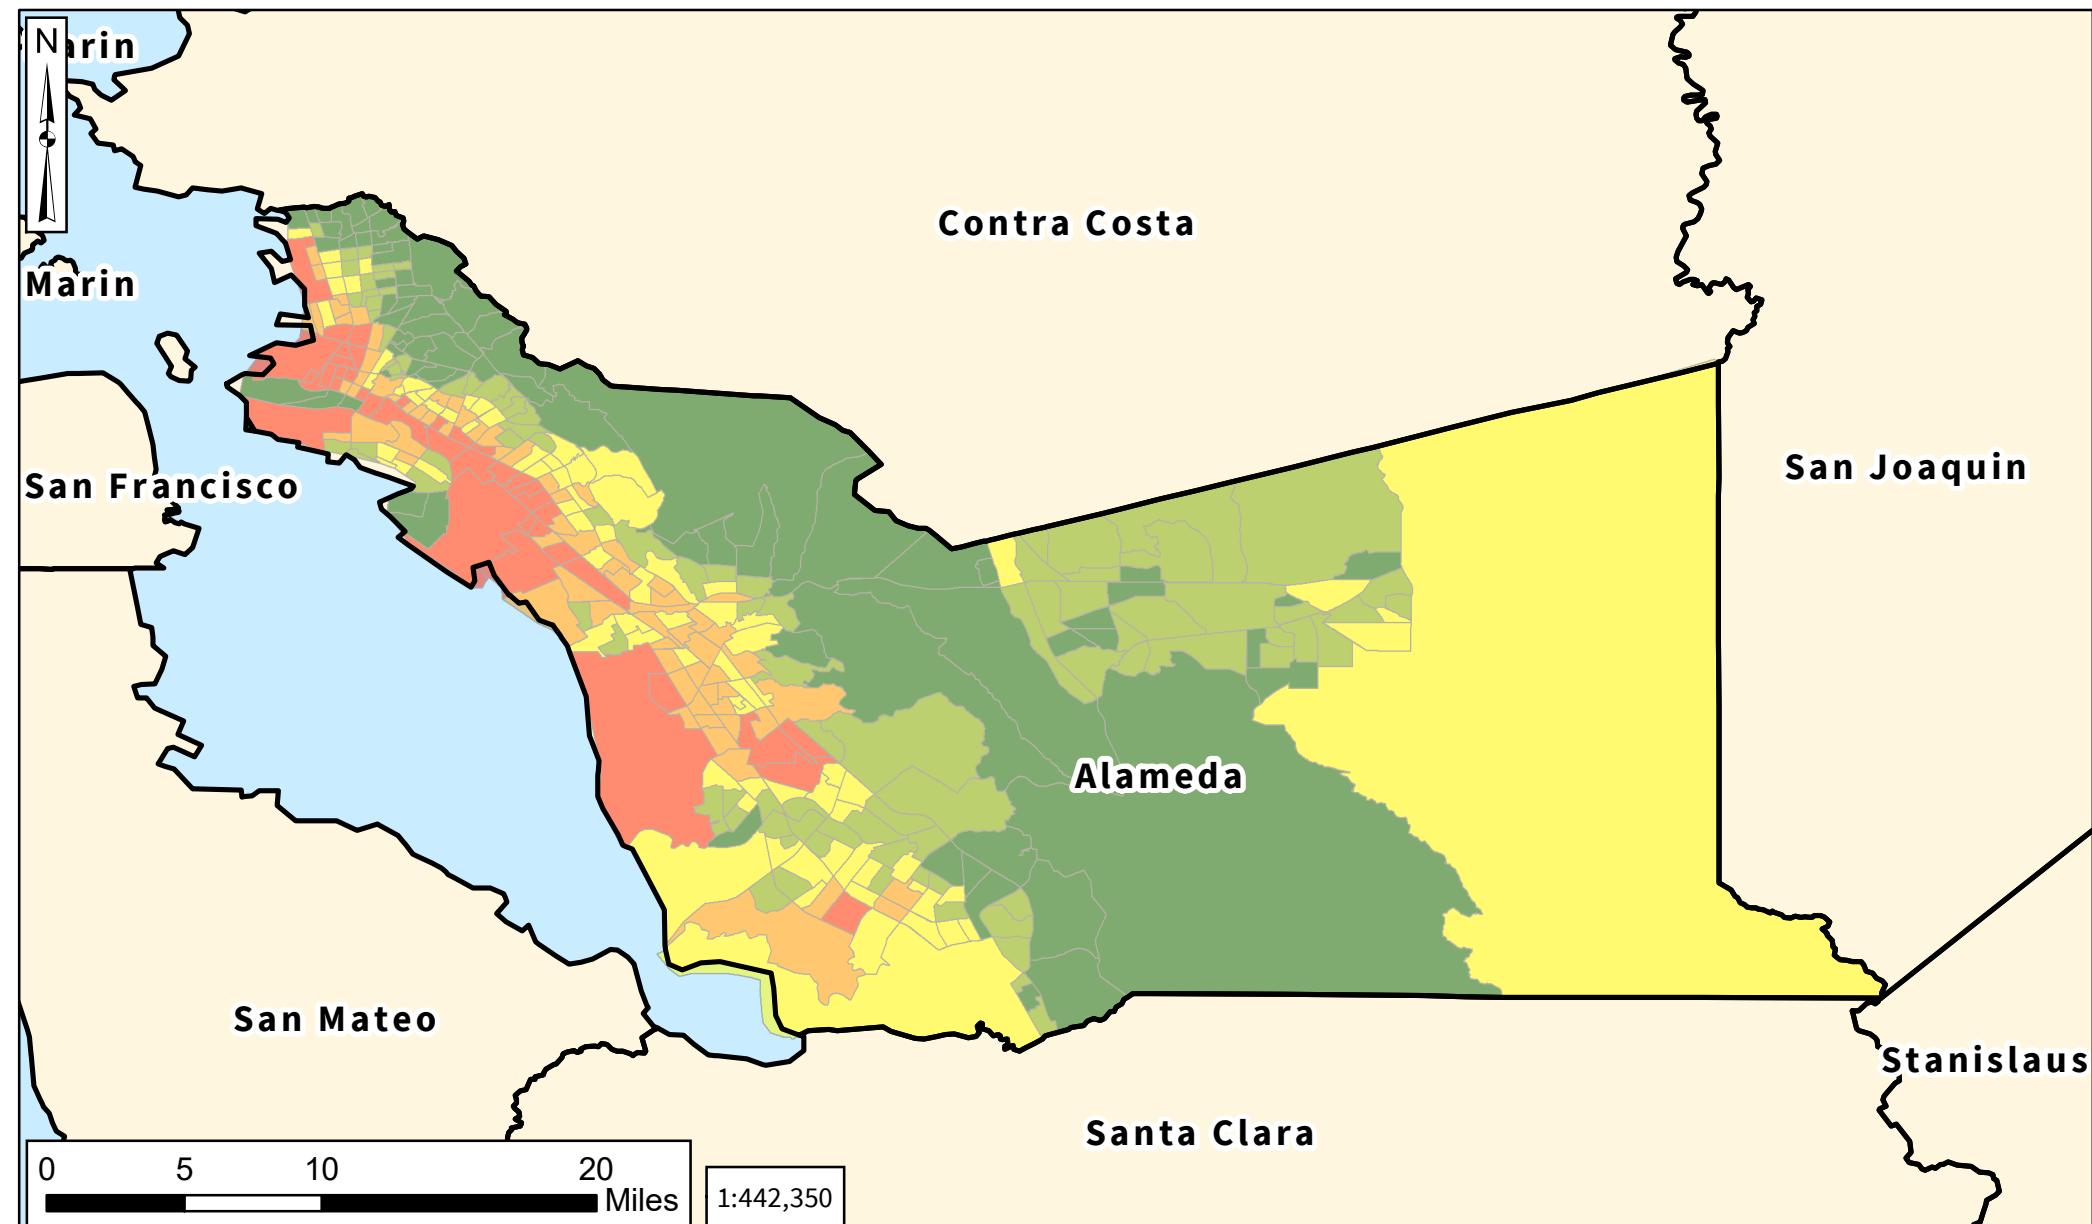

Unfortunately, cartography and GIS analysis are rarely so accommodating. Geographic boundaries are not uniform in size and shape. Data can come in many forms and various coordinate systems. It is these fine details that determine the quality of the cartography produced. Fortunately, some automation does assist in the production of map products that provide consistency and form in layout. However, the cartographer must pay close attention to the details in how the automation is rendering maps across the collection.

The tools available today, when utilized with an understanding of their limitations, can be very effective in assisting the cartographer to develop quality mapping products.
